

Slope and Rate of Change

Algebra 1 • Section 5.1

Name: _____

Date: _____

Score: _____ / 12

Quick Review and Helpful Hints

Linear relationships have a constant rate of change. Use slope, intercepts, points, and context to move between equations, tables, graphs, and real-world meanings.

► **Example:** Write the line with slope 2 through (3, 11).

Work: Use $y = 2x + b$. Substitute the point: $11 = 2(3) + b$, so $b = 5$.

★ **Answer:** $y = 2x + 5$

◆ Practice Problems

Solve each problem. Show enough work that another student could follow your thinking.

1. Find the slope through (1, 3) and (5, 11). _____

6. Find the slope of $y = -4x + 9$. _____

2. Find the slope through (-2, 7) and (4, -5). _____

7. Find the slope of $3x + 2y = 12$. _____

3. Find the slope of a horizontal line $y = 8$. _____

8. Find the slope between (0, -1) and (8, 3). _____

4. Find the slope of a vertical line $x = -3$. _____

9. Which is steeper: slope -5 or slope 2? _____

5. A table changes from (2, 10) to (6, 22). Find the rate. _____

10. Find the slope through (3, 3) and (9, 3). _____

◆ Word Problems

11. A runner goes from 2 miles at 10 minutes to 5 miles at 34 minutes. Find minutes per mile. _____

12. A tank drops from 90 gallons to 54 gallons in 6 hours. Find the rate of change. _____

Answer Keys

- | | |
|--------------|-------------------------|
| 1. 2 | 7. $-\frac{3}{2}$ |
| 2. -2 | 8. $\frac{1}{2}$ |
| 3. 0 | 9. Slope -5 |
| 4. Undefined | 10. 0 |
| 5. 3 | 11. 8 |
| 6. -4 | 12. -6 gallons per hour |

Step-by-Step Explanations

- Slope is rise over run, so stack the differences: $\frac{11-3}{5-1} = \frac{8}{4} = 2$.
- Subtract carefully: $\frac{-5-7}{4-(-2)} = \frac{-12}{6} = -2$. The negative just means the line heads downhill.
- Walk along this line and y never budges — zero rise means the slope is flat 0.
- There's no run at all here, and you can't divide by zero, so we say the slope is undefined.
- The output jumped 12 while the input only moved 4, so each step is worth $12/4 = 3$.
- When it's already $y = mx + b$, the number riding with x is your slope — that's -4 .
- Get y alone first: $2y = -3x + 12$ becomes $y = -\frac{3}{2}x + 6$, and the slope pops right out.
- Climbing 4 over a run of 8 means you only rise half a unit per step: $\frac{1}{2}$.
- Steepness ignores direction — compare sizes. Since 5 beats 2, the -5 line is steeper.
- Both points share the same height, so there's nothing to rise — the slope is 0.
- That's 24 extra minutes spread over 3 miles, so the pace works out to $24/3 = 8$ minutes each mile.
- Losing 36 gallons across 6 hours means $-36/6 = -6$ — negative because the tank is emptying.

Want Even More Algebra 1 Practice?

Wisconsin Algebra I Preparation Bundle

18 full-length practice tests across three books
Fresh test practice, detailed explanations, and
organized review

18 Tests
3 Books
One Bundle

Important: These Algebra 1 resources are made for extra practice after the worksheet. Use the QR code for the state or program bundle connected with this worksheet.

Skill Review

- ✓ Strengthens equations, functions, systems, and modeling
- ✓ Supports steady review before tests
- ✓ Good for tutoring, homework, and independent practice

Build the foundation.

Test Practice

- ✓ Full-length practice tests for realistic pacing
- ✓ Detailed answer explanations for every test
- ✓ Useful after students finish topic worksheets

Practice with purpose.

Confidence

- ✓ Turns mistakes into targeted review
- ✓ Helps students see progress over time
- ✓ Keeps preparation organized and calm

Move forward prepared.
