Q Quick Review

In real life you have to decide **which one a problem is asking for**. Use **area** when you are covering a surface — tiles on a floor, paint on a wall, grass in a yard — and multiply length \times width to get **square units**. Use **perimeter** when you are going around an edge — a fence, a border, a ribbon — and compute $2 \times (\text{length} + \text{width})$ to get plain **units**. **Read carefully** for clue words: “cover,” “inside,” and “square” point to area, while “around,” “fence,” and “border” point to perimeter.

◇ **Example:** A rectangular dog pen is 8 feet long and 5 feet wide. How many feet of fencing go around it, and how many square feet of ground does it cover?

⇒ This problem asks for two things. “Fencing around it” is the perimeter, so add length and width and double: $2 \times (8 + 5) = 2 \times 13 = 26$ feet of fencing. “Square feet of ground it covers” is the area, so multiply length times width: $8 \times 5 = 40$ square feet. Notice the units: perimeter uses feet, area uses square feet.

Answer: 26 ft of fencing; 40 square feet
