

Multiplying Two Two-Digit Numbers

Name: _____

Date: _____

Score: _____ / 24

Q Quick Review

To multiply two two-digit numbers, break the bottom number into its **ones** and **tens**. First multiply the top number by the ones digit. Then multiply the top number by the tens digit — and because that digit really means tens, write its product one place to the left (or put a 0 in the ones spot). Finally, **add** the two partial products together. For example, 42×18 is $(42 \times 8) + (42 \times 10)$. Estimating with rounded numbers helps you check your work.

◇ **Example:** Find 42×18 .

⇒ Split 18 into 8 ones and 1 ten. First multiply by the ones: $42 \times 8 = 336$. Next multiply by the tens: $42 \times 1 = 42$, but that 1 is really 10, so the partial product is 420. Now add the two partial products: $336 + 420 = 756$. Check by estimating: $40 \times 20 = 800$, which is close to 756 — great!

Answer: 756

PRACTICE

Multiply. Find each partial product, then add them.
