

Multiplying a Fraction by a Whole Number

Name: _____

Date: _____

Score: _____ / 24

Q Quick Review

Multiplying a fraction by a whole number is really just **repeated addition**. For example, $3 \times \frac{2}{5}$ means $\frac{2}{5} + \frac{2}{5} + \frac{2}{5}$. A quick way to do it: **multiply the whole number by the numerator**, and **keep the denominator the same**. So $3 \times \frac{2}{5} = \frac{3 \times 2}{5} = \frac{6}{5}$. If the answer is an **improper fraction** (top bigger than the bottom), you can rewrite it as a **mixed number**. And as always, write the final answer in **simplest form**.

◇ **Example:** Multiply $4 \times \frac{3}{8}$.

⇒ Think of this as adding $\frac{3}{8}$ four times. The shortcut is to multiply the whole number by the numerator: $4 \times 3 = 12$, and keep the denominator 8. That gives $\frac{12}{8}$. Now simplify and rewrite: $\frac{12}{8} = \frac{3}{2}$, which as a mixed number is $1\frac{1}{2}$.

Answer: $1\frac{1}{2}$
