

Classifying Two-Dimensional Figures

Grade 5 Math • Section 10.4

Name: _____

Date: _____

Score: _____ / 12

Quick Review and Helpful Hints

👉 **Hierarchy of quadrilaterals:** Quadrilateral \supset Parallelogram \supset Rectangle \supset Square. Quadrilateral \supset Parallelogram \supset Rhombus \supset Square. Quadrilateral \supset Trapezoid.

👉 **Triangles:** By sides: equilateral (all equal), isosceles (2 equal), scalene (none equal). By angles: acute (all $< 90^\circ$), right (one = 90°), obtuse (one $> 90^\circ$).

💡 Figures can belong to more than one category. A square is a rectangle, rhombus, parallelogram, **and** quadrilateral.

🔍 **Example:** Classify a figure with 4 equal sides and 4 right angles. Name all categories it belongs to.

👉 Four equal sides makes it a rhombus. Four right angles makes it a rectangle. Both a rhombus and a rectangle means it is a square. It is also a parallelogram and a quadrilateral.

💡 **Answer:** Square, rectangle, rhombus, parallelogram, quadrilateral

Practice Problems

Classify each figure. List all categories it belongs to.

- A shape has 4 sides, 2 pairs of parallel sides, and 4 right angles but sides are not all equal. _____
- A shape has 3 sides, all different lengths, and one 90° angle. _____
- A shape has 4 equal sides but no right angles. _____
- A shape has 4 sides and exactly one pair of parallel sides. _____
- A shape has 3 sides all the same length. _____
- Can a triangle be both right and isosceles? Explain. _____
- A shape has 4 sides, opposite sides parallel and equal, and no right angles. What is it? _____
- Is every square a rhombus? Is every rhombus a square? Explain. _____
- A triangle has sides of length 5 cm, 5 cm, and 8 cm. Classify it by sides. _____
- Name a quadrilateral that is NOT a parallelogram. _____

Word Problems

- A city park is shaped like a quadrilateral with two pairs of parallel sides and all four angles are 90° , but not all sides are equal. What shape is the park? List all categories it belongs to. _____
- Draw or describe two different quadrilaterals that are both parallelograms but are NOT rectangles. What properties do they share? _____

Answer Keys

- | | |
|---------------------------|--|
| 1. rectangle | 7. parallelogram |
| 2. right scalene triangle | 8. Yes; no |
| 3. rhombus | 9. isosceles triangle |
| 4. trapezoid | 10. trapezoid |
| 5. equilateral triangle | 11. rectangle; quadrilateral and parallelogram |
| 6. Yes | 12. rhombus and slanted parallelogram |

Step-by-Step Explanations

1. Start with the main idea. For classifying 2-D figures, four right angles and two pairs of parallel sides make a rectangle; not all sides equal means it is not a square. Use the properties one at a time: sides, angles, and parallel sides.
2. Keep the work tidy. For classifying 2-D figures, it has one right angle and all side lengths are different. A shape can belong to more than one category when it satisfies more than one definition.
3. Look at what the numbers mean. For classifying 2-D figures, four equal sides with no right angles describes a rhombus. Counterexamples are useful: one shape that breaks a claim shows the claim is not always true.
4. Use the setup first. For classifying 2-D figures, exactly one pair of parallel sides describes a trapezoid. Use the properties one at a time: sides, angles, and parallel sides.
5. Check the size of the answer. For classifying 2-D figures, all three sides have the same length. A shape can belong to more than one category when it satisfies more than one definition.
6. Match the operation to the words. For classifying 2-D figures, a right isosceles triangle can have a 90° angle and two equal legs. Counterexamples are useful: one shape that breaks a claim shows the claim is not always true.
7. Write the important values first. For classifying 2-D figures, opposite sides

parallel and equal describes a parallelogram; no right angles means not a rectangle. Use the properties one at a time: sides, angles, and parallel sides.

8. Follow the pattern carefully. For classifying 2-D figures, every square has four equal sides, so it is a rhombus; a rhombus does not need four right angles. A shape can belong to more than one category when it satisfies more than one definition.

9. Start with the main idea. For classifying 2-D figures, two sides are equal: 5 cm and 5 cm. Counterexamples are useful: one shape that breaks a claim shows the claim is not always true.

10. Keep the work tidy. For classifying 2-D figures, a trapezoid is a quadrilateral but not a parallelogram. Use the properties one at a time: sides, angles, and parallel sides.

11. Look at what the numbers mean. For classifying 2-D figures, two pairs of parallel sides and four right angles make it a rectangle, which is also a parallelogram and quadrilateral. A shape can belong to more than one category when it satisfies more than one definition.

12. Use the setup first. For classifying 2-D figures, both have two pairs of parallel opposite sides, but they do not have four right angles. Counterexamples are useful: one shape that breaks a claim shows the claim is not always true.

Want Even More Practice?

Check Out Our Other Arizona AASA Test Books!

Arizona AASA Grade 5 Math Preparation Bundle

18 full-length practice tests across three books
(5 + 6 + 7)

No repeated questions—maximum practice value!

18 Tests!
3 Books
One Bundle

Important: All our test books contain **unique, completely different tests** from each other! Each book offers fresh practice questions—no repeats!

5 Practice Tests

- ✓ 5 complete practice tests with detailed explanations
- ✓ Perfect foundation for AASA test preparation
- ✓ Builds confidence and test-taking skills
- ✓ High-quality questions aligned with state standards

Start your practice journey!

6 Practice Tests

- ✓ 6 complete practice tests with detailed explanations
- ✓ **Unique tests**—different from the 5 tests book
- ✓ Perfect for more practice after mastering 5 tests
- ✓ Builds even more confidence and test-taking skills
- ✓ Same high-quality questions aligned with standards

Take your practice to the next level!

7 Practice Tests

- ✓ 7 complete practice tests for maximum preparation
- ✓ **Unique tests**—different from 5 and 6 tests books
- ✓ The most comprehensive practice for Grade 5
- ✓ Ideal for students aiming for top scores
- ✓ Extensive practice builds mastery and confidence

Go all the way with comprehensive practice!
