

# Adding Fractions with Unlike Denominators

Name: \_\_\_\_\_

Date: \_\_\_\_\_

Score: \_\_\_\_\_ / 24

## Q Quick Review

To add fractions, the pieces must be the same size — that means the **denominators must match**. When they do not, rewrite each fraction using a **common denominator**, usually the **least common multiple** of the two denominators. For  $\frac{1}{2} + \frac{1}{3}$ , the common denominator is 6: rewrite as  $\frac{3}{6} + \frac{2}{6}$ . Then **add the numerators** and keep the denominator:  $\frac{5}{6}$ . Finally, **simplify** if you can. The denominator never gets added — it just names the size of the pieces.

◇ **Example:** Add  $\frac{1}{2} + \frac{1}{3}$ .

⇒ The denominators 2 and 3 are different, so first find a common denominator — the smallest number both divide into is 6. Rewrite each fraction with 6 on the bottom:  $\frac{1}{2} = \frac{3}{6}$  and  $\frac{1}{3} = \frac{2}{6}$ . Now the pieces match, so add the numerators:  $3 + 2 = 5$ . The denominator stays 6, giving  $\frac{5}{6}$ . It is already in simplest form.

**Answer:**  $\frac{5}{6}$
