

Adding Fractions with Unlike Denominators

Name: _____ Date: _____ Score: _____ / 24

Q Quick Review

To add fractions, the pieces must be the same size — that means the **denominators must match**. When they do not, rewrite each fraction using a **common denominator**, usually the **least common multiple** of the two denominators. For $\frac{1}{2} + \frac{1}{3}$, the common denominator is 6: rewrite as $\frac{3}{6} + \frac{2}{6}$. Then **add the numerators** and keep the denominator: $\frac{5}{6}$. Finally, **simplify** if you can. The denominator never gets added — it just names the size of the pieces.

◇ **Example:** Add $\frac{1}{2} + \frac{1}{3}$.

⇒ The denominators 2 and 3 are different, so first find a common denominator — the smallest number both divide into is 6. Rewrite each fraction with 6 on the bottom: $\frac{1}{2} = \frac{3}{6}$ and $\frac{1}{3} = \frac{2}{6}$. Now the pieces match, so add the numerators: $3 + 2 = 5$. The denominator stays 6, giving $\frac{5}{6}$. It is already in simplest form.

Answer: $\frac{5}{6}$
