

Adding and Subtracting Mixed Numbers

Name: _____ Date: _____ Score: _____ / 24

Q Quick Review

A **mixed number** like $1\frac{3}{4}$ is a whole number plus a fraction. One reliable way to add or subtract them is to first turn each into an **improper fraction**: multiply the whole number by the denominator, add the numerator, and keep the denominator. So $1\frac{3}{4} = \frac{7}{4}$. Then use a **common denominator**, add or subtract the numerators, and **convert back** to a mixed number at the end. This method avoids tricky regrouping and works every time.

◇ **Example:** Add $1\frac{3}{4} + 1\frac{1}{6}$.

⇒ Change each mixed number to an improper fraction. For $1\frac{3}{4}$: $1 \times 4 + 3 = 7$, so it is $\frac{7}{4}$. For $1\frac{1}{6}$: $1 \times 6 + 1 = 7$, so it is $\frac{7}{6}$. The common denominator of 4 and 6 is 12: $\frac{7}{4} = \frac{21}{12}$ and $\frac{7}{6} = \frac{14}{12}$. Add: $\frac{21}{12} + \frac{14}{12} = \frac{35}{12}$. Convert back: $35 \div 12 = 2$ remainder 11, so the answer is $2\frac{11}{12}$.

Answer: $2\frac{11}{12}$

PRACTICE

Add or subtract. Write each answer as a mixed number in simplest form.
