

Area of Circles Introduction

Name: _____

Date: _____

Score: _____ / 24

Q Quick Review

A **circle** is measured from its center. The **radius** r is the distance from the center to the edge, and the **diameter** d goes all the way across through the center, so $d = 2r$ and $r = \frac{d}{2}$. The **area** of a circle is $A = \pi \times r^2$. In this section, use $\pi \approx 3.14$. The steps are: if you are given the diameter, first cut it in half to get the radius; then square the radius (multiply it by itself); then multiply by 3.14. Area is always in **square units**.

◇ **Example:** Find the area of a circle with a radius of 6 inches. Use $\pi \approx 3.14$.

⇒ Use the formula $A = \pi \times r^2$. First square the radius: $6^2 = 6 \times 6 = 36$. Now multiply by 3.14: $3.14 \times 36 = 113.04$. Since the radius was measured in inches, the area is in square inches. Notice we square the radius *before* multiplying by π .

Answer: 113.04 in²
