

Area of Rectangles and Squares

Name: _____ Date: _____ Score: _____ / 24

Q Quick Review

The **area** of a shape is the amount of flat space it covers, measured in **square units**. For a **rectangle**, area equals **length times width**: $A = l \times w$. A **square** is just a rectangle whose sides are all equal, so its area is **side times side**: $A = s \times s = s^2$. Always include square units in your answer, like cm^2 or ft^2 . If side lengths are decimals or fractions, multiply them the same careful way — the formula never changes.

◊ **Example:** Find the area of a rectangle with length 8 cm and width 5 cm.
 ⇒ For a rectangle, area is length times width. Here the length is 8 cm and the width is 5 cm, so multiply: $8 \times 5 = 40$. Because we multiplied centimeters by centimeters, the units become square centimeters. So the area is 40 square centimeters, written 40 cm^2 .

Answer: 40 cm^2

PRACTICE

Find the area of each rectangle or square. Include square units.
