

# Distance on the Coordinate Plane

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Score: \_\_\_\_\_ / 24

## Q Quick Review

When two points share the **same  $x$ -coordinate**, they lie on a *vertical* line, and the distance between them is the difference of their  $y$ -coordinates. When two points share the **same  $y$ -coordinate**, they lie on a *horizontal* line, and the distance is the difference of their  $x$ -coordinates. To find that difference, subtract and take the **absolute value** so the distance is positive. A shortcut: if the signs differ, *add* the absolute values; if the signs match, *subtract* them.

◇ **Example:** Find the distance between  $(3, 2)$  and  $(3, -5)$ .

⇒ Notice both points have the same  $x$ -coordinate, 3, so they sit on the same vertical line. That means the distance is just how far apart their  $y$ -coordinates are. The  $y$ -values are 2 and  $-5$ . Subtract and take the absolute value:  $|2 - (-5)| = |2 + 5| = |7| = 7$ . Since one point is above the  $x$ -axis and one is below, it also makes sense to add the distances  $2 + 5 = 7$ . The distance is 7 units.

**Answer:** 7
