

Distance on the Coordinate Plane

Name: _____ Date: _____ Score: _____ / 24

Q Quick Review

When two points share the **same x -coordinate**, they lie on a *vertical* line, and the distance between them is the difference of their y -coordinates. When two points share the **same y -coordinate**, they lie on a *horizontal* line, and the distance is the difference of their x -coordinates. To find that difference, subtract and take the **absolute value** so the distance is positive. A shortcut: if the signs differ, *add* the absolute values; if the signs match, *subtract* them.

◇ **Example:** Find the distance between $(3, 2)$ and $(3, -5)$.

⇒ Notice both points have the same x -coordinate, 3, so they sit on the same vertical line. That means the distance is just how far apart their y -coordinates are. The y -values are 2 and -5 . Subtract and take the absolute value: $|2 - (-5)| = |2 + 5| = |7| = 7$. Since one point is above the x -axis and one is below, it also makes sense to add the distances $2 + 5 = 7$. The distance is 7 units.

Answer: 7
