Finding the Unit Rate

Name: _____	Date: _____	Score: _____ / 24

Quick Review

A **unit rate** tells you the amount for *exactly one* of something — one hour, one pound, one ticket. To find a unit rate, **divide the first quantity by the second**. For "120 miles in 3 hours," divide $120 \div 3 = 40$, so the unit rate is 40 miles per hour. Unit rates make it easy to **compare deals**: if one pack costs $\$0.50$ per pencil and another costs $\$0.40$ per pencil, the second is the better buy. A unit rate always has a 1 in the denominator.

◇ **Example:** A store sells 4 pounds of apples for $\$12$. Find the unit price.

⇒ A unit price is the cost for just *one* pound. To find it, we divide the total cost by the number of pounds: $\$12 \div 4$ pounds. That gives $\$3$ per pound. Here is a helpful check: if one pound is $\$3$, then 4 pounds would be $4 \times \$3 = \$12$, which matches. So the unit price is $\$3$ per pound.

Answer: $\$3$ per pound
