## Q Quick Review

For multiplying or dividing integers, the **sign rules** are simple. If the two numbers have the **same sign**, the answer is **positive**. If they have **different signs**, the answer is **negative**. So  $(-6)(7) = -42$  but  $(-8)(-3) = 24$ . First multiply or divide the numbers as if they were positive, then attach the correct sign. When you multiply several numbers, count the negative signs: an *even* number of negatives gives a positive, an *odd* number gives a negative.

◇ **Example:** Find  $(-8)(-3)$ .

⇒ First ignore the signs and multiply the plain numbers:  $8 \times 3 = 24$ . Now decide the sign. Both factors are negative, which means they have the *same* sign. The same-sign rule tells us the answer is positive. So  $(-8)(-3) = 24$ . A helpful way to remember: a negative of a negative turns positive, just like  $-(-3) = 3$ .

**Answer:** 24

Same sign gives a positive: <math>100 \div 25 = 4</math>.</p> | <p>16. Same sign gives a positive: <math>81 \div 9 = 9</math>.</p> <p>17. One negative sign (odd), so the product is negative: <math>2 \times 5 \times 3 = 30</math>, giving <math>-30</math>.</p> <p>18. Three negative signs (odd), so the product is negative: <math>3 \times 4 \times 2 = 24</math>, giving <math>-24</math>.</p> <p>19. Three negatives (odd) give a negative: <math>4 \times 4 \times 4 = 64</math>, so <math>-64</math>.</p> <p>20. <math>(-2)^3 = (-2)(-2)(-2)</math>; three negatives give a negative 8, so <math>-8</math>.</p> <p>21. Descending 3 feet is <math>-3</math> per minute, so over 8 minutes the change is <math>(-3)(8) = -24</math> feet.</p> <p>22. A loss of \$250 is <math>-250</math>. Divided over 5 days: <math>-250 \div 5 = -50</math>, so <math>-\\$50</math> per day.</p> <p>23. <math>(-6)(-7) = 42</math>.
