Name: _____

Date: _____

Score: _____ / 24

Q Quick Review

Multiplying fractions is wonderfully simple: **multiply the numerators together** and **multiply the denominators together**.

So $\frac{2}{3} \times \frac{3}{4} = \frac{2 \times 3}{3 \times 4} = \frac{6}{12}$. There is no need for a common denominator. To make the work easier, you can **cancel common factors** before multiplying — divide a numerator and a denominator by a shared factor. Always **simplify** the final answer.

Remember: “of” usually means multiply, so $\frac{1}{2}$ of $\frac{4}{5}$ means $\frac{1}{2} \times \frac{4}{5}$.

◇ **Example:** Multiply $\frac{2}{3} \times \frac{3}{4}$.

⇒ Multiply straight across. The numerators: $2 \times 3 = 6$. The denominators: $3 \times 4 = 12$. That gives $\frac{6}{12}$. Now simplify — the greatest common factor of 6 and 12 is 6, so $\frac{6}{12} = \frac{1}{2}$. (Tip: you could also cancel the 3 on top with the 3 on bottom first, which gets you to $\frac{1}{2}$ even faster.)

Answer: $\frac{1}{2}$
