## Q Quick Review

Multiplying fractions is wonderfully simple: **multiply the numerators together** and **multiply the denominators together**.

So  $\frac{2}{3} \times \frac{3}{4} = \frac{2 \times 3}{3 \times 4} = \frac{6}{12}$ . There is no need for a common denominator. To make the work easier, you can **cancel common factors** before multiplying — divide a numerator and a denominator by a shared factor. Always **simplify** the final answer.

Remember: “of” usually means multiply, so  $\frac{1}{2}$  of  $\frac{4}{5}$  means  $\frac{1}{2} \times \frac{4}{5}$ .

◇ **Example:** Multiply  $\frac{2}{3} \times \frac{3}{4}$ .

⇒ Multiply straight across. The numerators:  $2 \times 3 = 6$ . The denominators:  $3 \times 4 = 12$ . That gives  $\frac{6}{12}$ . Now simplify — the greatest common factor of 6 and 12 is 6, so  $\frac{6}{12} = \frac{1}{2}$ . (Tip: you could also cancel the 3 on top with the 3 on bottom first, which gets you to  $\frac{1}{2}$  even faster.)

**Answer:**  $\frac{1}{2}$
