

# Opposites and Absolute Value

## Q Quick Review

Two numbers are **opposites** if they are the same distance from 0 but on different sides — like 7 and  $-7$ . The opposite of a number just flips its sign, and the opposite of 0 is 0. The **absolute value** of a number, written  $|x|$ , is its *distance* from 0 on the number line, so it is never negative. For example,  $|-7| = 7$  and  $|7| = 7$  because both are 7 units from zero. Watch the signs carefully:  $-(-9)$  means “the opposite of  $-9$ ,” which is 9.

◇ **Example:** Find  $|-12|$  and the opposite of  $-12$ .

⇒ Start with absolute value.  $|-12|$  asks: how far is  $-12$  from 0 on the number line? It is 12 units away, so  $|-12| = 12$ . Distance is never negative. Now the opposite: the opposite of a number is found on the other side of 0, the same distance away. The opposite of  $-12$  is 12. Interesting — for this number the absolute value and the opposite turned out the same, because  $-12$  is negative.

**Answer:**  $|-12| = 12$ , opposite = 12
