

Proportional vs. Non-Proportional Relationships

Name: _____ Date: _____ Score: _____ / 24

Q Quick Review

Two quantities have a **proportional relationship** when their ratio is always the *same* — in other words, $\frac{y}{x}$ gives a **constant** value for every pair. For example, (1, 3), (2, 6), (4, 12) are proportional because $\frac{3}{1} = \frac{6}{2} = \frac{12}{4} = 3$ every time. If the ratios are *not* all equal, the relationship is **non-proportional**. On a graph, proportional relationships form a straight line *through the origin* (0, 0). To test a table, just check whether every $\frac{y}{x}$ matches.

◇ **Example:** Is the relationship in this table proportional? (2, 6), (3, 9), (5, 15).

⇒ To test for a proportional relationship, find the ratio $\frac{y}{x}$ for every pair and see if they all match. For (2, 6): $\frac{6}{2} = 3$. For (3, 9): $\frac{9}{3} = 3$. For (5, 15): $\frac{15}{5} = 3$. Every ratio equals 3, so the quantities are proportional, with a constant ratio of 3.

Answer: Yes, proportional (constant ratio 3)

PRACTICE

Decide whether each relationship is proportional. Answer Yes or No.

It passes through the origin with constant ratio 3, so yes.</p> <p>20. It does not pass through the origin, so it is non-proportional.</p> <p>21. Each ratio $\frac{\text{cost}}{\text{miles}}$ equals 2: $\frac{6}{3}$, $\frac{10}{5}$, $\frac{16}{8}$ are all 2. With no starting fee, the graph passes through the origin.</p> <p>22. $\frac{15}{1} = 15$ but $\frac{20}{2} = 10$ — the ratios are not equal. The sign-up fee means the graph does not pass through the origin.</p> <p>23. Each ratio $\frac{\text{cups}}{\text{batches}}$ equals 2: $\frac{2}{1}$, $\frac{6}{3}$, $\frac{10}{5}$ are all 2.</p> <p>24. $\frac{6}{1} = 6$ but $\frac{8}{2} = 4$ — the ratios differ. The plant started at 4 inches, not 0, so the graph misses the origin.</p> |
