## Q Quick Review

A **proportion** is an equation that says two ratios are equal, like  $\frac{2}{3} = \frac{8}{12}$ . When one number is missing, you can solve the proportion with **cross multiplication**: multiply each numerator by the *opposite* denominator and set the products equal. For  $\frac{x}{4} = \frac{6}{8}$  this gives  $8x = 4 \times 6$ . Then **divide** to find the unknown. Cross multiplication works because equal ratios always have equal “cross products.” Always check by plugging your answer back in.

◇ **Example:** Solve the proportion  $\frac{x}{4} = \frac{6}{8}$ .

⇒ We have two equal ratios with one missing piece. Cross multiply: multiply  $x$  by 8 and multiply 4 by 6, then set them equal. That gives  $8x = 24$ . Now undo the multiplication by dividing both sides by 8:  $x = 24 \div 8 = 3$ . Check it:  $\frac{3}{4} = \frac{6}{8}$  because both simplify to the same ratio. Perfect.

**Answer:**  $x = 3$
