Q Quick Review

A **scale drawing** (like a map or blueprint) shows a real object smaller or larger using a fixed ratio called the **scale**. A scale of “1 in : 4 ft” means every 1 inch on the drawing stands for 4 feet in real life. To find a **real distance**, multiply the drawing length by the scale factor: 3 inches becomes $3 \times 4 = 12$ feet. To find a **drawing length** from a real distance, divide instead. Keep the units in the same order as the scale, and your answer will make sense.

◇ **Example:** A map uses the scale 1 in : 25 mi. A road is 4 inches long on the map. How long is the real road?
 ⇒ The scale tells us each inch on the map stands for 25 real miles. To go from the drawing length to the real distance, we multiply by the scale factor. The road is 4 inches on the map, so we compute $4 \times 25 = 100$. The real road is 100 miles long. Since the real distance should be much bigger than the map length, multiplying makes sense.

Answer: 100 miles

PRACTICE

Use the given scale to find each missing length.

◆ Word Problems

21. On a map, the scale is 1 inch : 25 miles. Two cities are 4 inches apart on the map. What is the real distance between the cities? _____
22. A blueprint uses the scale 1 inch : 8 feet. A wall is drawn 2.5 inches long. How long is the real wall? _____
23. A model of a building uses the scale 1 cm : 2 m. The real building is 18 m tall. How tall is the model? _____
24. A floor plan uses the scale 1 inch : 6 feet. A real room is 30 feet wide. How wide is the room on the floor plan? _____
