

Solving Rate and Ratio Word Problems

Name: _____ Date: _____ Score: _____ / 24

Q Quick Review

Many real-world problems are solved by **scaling a ratio up or down**. The key step is to find the **unit rate** first, then multiply by the amount you need. If 3 pens cost \$6, the unit rate is $\$6 \div 3 = \2 per pen, so 7 pens cost $7 \times \$2 = \14 . You can also use a ratio table or set up equivalent ratios. Always check that your units line up and that your answer makes sense — more items should cost more, and faster speeds cover more distance.

◊ **Example:** If 4 notebooks cost \$12, how much do 9 notebooks cost?
 ⇒ First find the cost of just one notebook — the unit rate. Divide the total cost by the number of notebooks: $\$12 \div 4 = \3 per notebook. Now scale up to 9 notebooks by multiplying: $9 \times \$3 = \27 . Let's check that it makes sense: 9 notebooks is more than 4, so the cost should be more than \$12, and \$27 is.

Answer: \$27
