## Q Quick Review

A **transformation** moves a point or shape to a new spot. A **translation** slides a point: moving right adds to  $x$ , left subtracts from  $x$ , up adds to  $y$ , and down subtracts from  $y$ . A **reflection** flips a point over a line, like a mirror. Reflecting over the  $x$ -axis keeps  $x$  the same and flips the sign of  $y$ :  $(x, y) \rightarrow (x, -y)$ . Reflecting over the  $y$ -axis keeps  $y$  the same and flips the sign of  $x$ :  $(x, y) \rightarrow (-x, y)$ . Take it one coordinate at a time and you will not get mixed up.

◇ **Example:** The point  $(3, 2)$  is translated 5 units right and 3 units up. What are its new coordinates?

⇒ Handle the  $x$ -coordinate first. Moving 5 units right means adding 5 to the  $x$ -value:  $3 + 5 = 8$ . Now the  $y$ -coordinate. Moving 3 units up means adding 3 to the  $y$ -value:  $2 + 3 = 5$ . Put the two new coordinates together to get the image point  $(8, 5)$ .

**Answer:**  $(8, 5)$

## PRACTICE

Find the new coordinates after each transformation. Write answers as ordered pairs.
