## Q Quick Review

A **rate** is a special ratio that compares two amounts measured in *different units*. “120 miles in 3 hours” and “\$6 for 4 pounds” are both rates. We often write a rate as a fraction with the units included, like  $\frac{120 \text{ miles}}{3 \text{ hours}}$ . The word **per** means “for each” and almost always points to a rate — miles *per* hour, dollars *per* pound, words *per* minute. A rate stays the same value even as the numbers grow, so  $\frac{120}{3}$  describes the same speed as  $\frac{40}{1}$ .

◇ **Example:** A car travels 150 miles in 5 hours. Write this as a rate.

⇒ A rate compares two different units — here, miles and hours. We write it as a fraction with the labels:  $\frac{150 \text{ miles}}{5 \text{ hours}}$ . This is already a correct rate. If we want to compare it to other speeds easily, we can simplify it by dividing top and bottom by 5:  $\frac{150 \div 5}{5 \div 5} = \frac{30 \text{ miles}}{1 \text{ hour}}$ . That tells us the car covers 30 miles in each hour.

**Answer:**  $\frac{150 \text{ miles}}{5 \text{ hours}} = 30 \text{ miles per hour}$

## PRACTICE

Write each comparison as a rate. Simplify where shown.
