

Translations, Reflections, and Rotations

Name: _____

Date: _____

Score: _____ / 18

A **transformation** moves or changes a figure on the coordinate plane, and in this topic you will meet three important ones! **Translations** (slides) shift every point the same distance in the same direction; **reflections** (flips) mirror a figure across a line like the x -axis or y -axis; and **rotations** (turns) spin a figure around a fixed point, usually the origin. All three are *rigid motions*—they change position but never size or shape, so the original and the image are always congruent. Each one has a simple coordinate rule (for example, reflecting over the x -axis sends (x, y) to $(x, -y)$), and learning those rules lets you move figures with precision and describe the motion with algebra!

Key Concepts & Quick Review

Translation $(x, y) \rightarrow (x + a, y + b)$: every point shifts a units horizontally and b units vertically.

Reflection rules for common lines of reflection:

- Over the x -axis: $(x, y) \rightarrow (x, -y)$
- Over the y -axis: $(x, y) \rightarrow (-x, y)$
- Over $y = x$: $(x, y) \rightarrow (y, x)$

Rotation about the origin (counter-clockwise):

- 90° : $(x, y) \rightarrow (-y, x)$
- 180° : $(x, y) \rightarrow (-x, -y)$
- 270° : $(x, y) \rightarrow (y, -x)$

All three transformations produce an image **congruent** to the original figure.

Examples

① Translate the point $(3, -2)$ by $(x + 4, y - 1)$.

Think It Through: A translation slides every point the same amount, so just add the shift to each coordinate. For x : $3 + 4 = 7$. For y : $-2 - 1 = -3$. The image lands at $(7, -3)$ —the point moved 4 units

right and 1 unit down, which is exactly what the rule says.

Answer: $(7, -3)$

② Rotate the point $(2, 5)$ by 90° counter-clockwise about the origin.

Think It Through: For a 90° counter-clockwise rotation about the origin, the rule is $(x, y) \rightarrow (-y, x)$. Plug in: the new x -coordinate becomes -5 (flip the sign of the old y), and the new y -coordinate becomes 2 (the old x stays the same). The image is $(-5, 2)$.

Answer: $(-5, 2)$

Practice Problems

Apply the transformation. Write the coordinates of the image point.

1. Translate the point $(1, 4)$ using the rule $(x, y) \rightarrow (x + 3, y - 2)$. Write the image point. _____
2. Translate the point $(-2, 5)$ using the rule $(x, y) \rightarrow (x - 1, y + 4)$. Write the image point. _____
3. Reflect the point $(0, 3)$ over the x -axis. Write the image point. _____
4. Reflect the point $(4, -1)$ over the y -axis. Write the image point. _____
5. Rotate the point $(6, 2)$ 90° counterclockwise about the origin. Write the image point. _____
6. Rotate the point $(3, -4)$ 180° about the origin. Write the image point. _____
7. Reflect the point $(-5, 1)$ over the x -axis. Write the image point. _____
8. Translate the point $(2, 7)$ using the rule $(x, y) \rightarrow (x - 5, y - 3)$. Write the image point. _____
9. Rotate the point $(-3, -2)$ 270° counterclockwise about the origin. Write the image point. _____
10. Reflect the point $(1, -6)$ over the y -axis. Write the image point. _____

11. Rotate the point $(4, 0)$ 90° counterclockwise about the origin. Write the image point. _____

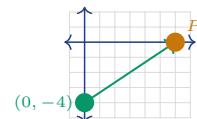

12. Reflect the point $(5, 5)$ over the line $y = x$. Write the image point. _____

13. Rotate the point $(-1, 3)$ 180° about the origin. Write the image point. _____

14. Translate the point $(0, -4)$ using the rule $(x, y) \rightarrow (x + 6, y + 4)$. Write the image point. _____

15. Reflect the point $(7, 2)$ over the x -axis. Write the image point.

Study Tips

- 👉 For **reflections**, think of folding the paper along the line of reflection. The image is the same distance from the line as the original.
- 👉 Memorise the three rotation rules. A quick check: after a 90° CCW rotation, a point in Quadrant I moves to Quadrant II.
- 👉 Rigid motions do **not** change lengths or angles. If the image is a different size, the transformation is not a translation, reflection, or rotation.

Word Problems

16. A triangle has vertices $A(1, 2)$, $B(4, 2)$, and $C(4, 6)$. It is translated 3 units left and 2 units up. What are the new vertices? _____
17. Point $P(3, -1)$ is reflected over the x -axis and then rotated 90° counter-clockwise about the origin. What are the final coordinates? _____
18. This coordinate plane shows a pre-image triangle $\triangle ABC$ and its image $\triangle A'B'C'$. Identify the transformation (translation, reflection, or rotation) that maps the pre-image to the image, list the coordinates of the three image vertices, and write the rule (e.g., $(x, y) \rightarrow (\dots)$). _____

Step-by-Step Explanations

Strategy: For Solving Multi-Step Problems with Rational Numbers, choose the operation that matches the story, then keep fractions and signs organized through every step. The context should tell whether the answer is a total, a change, a distance, or a rate.

Practice 1: $\frac{x}{2} + 3 = 7$ **Answer:** 8

At the beginning of the practice, combine like terms on both sides before choosing the inverse operation.

Practice 15: $2(0.5x-3)=4$ **Answer:** 10

For the second model problem, clear parentheses and constants step by step so the final variable term is visible.

Word-problem notes:

16. Answer: $12.5 + 8.75w = 30 + 5.5w \Rightarrow w = \frac{70}{13} \approx 5.38$ weeks; each will have about \$59.62; Devon saves \$3.25/wk faster.

Write an expression for each friend's savings after w weeks. Devon has $12.5 + 8.75w$, and Kenji has $30 + 5.5w$. Set them equal because the question asks when the amounts match: $12.5 + 8.75w = 30 + 5.5w$. Subtract $5.5w$ to get $12.5 + 3.25w = 30$, then subtract 12.5 and divide by 3.25. This gives $w = \frac{70}{13} \approx 5.38$ weeks. Substituting that value back in shows each will have about \$59.62. Devon saves faster because $8.75 - 5.50 = 3.25$, so he saves \$3.25 more per week.

17. Answer: $-\frac{3}{8}t = -4.5 \Rightarrow t = 12 \text{ min}$; total: $12 + 15 = 27 < 30 \text{ min}$ — yes, possible.

The ranger is going downward, so the elevation change equation is $-\frac{3}{8}t = -4.5$. To solve for time, divide both sides by $-\frac{3}{8}$, or multiply by its reciprocal. That gives $t = 12 \text{ min}$. Now add the 15-minute setup time: $12 + 15 = 27 \text{ min}$. Since $27 < 30$, the full operation is possible within the required time limit.

Want Even More Practice?

Check Out Our Other District of Columbia DC CAPE Test Books!

District of Columbia DC CAPE Grade 7 Math Preparation Bundle

18 full-length practice tests across three books (5 + 6 + 7)

No repeated questions—maximum practice value!

18 Tests!
3 Books
One Bundle

Important: All our test books contain **unique, completely different tests** from each other! Each book offers fresh practice questions—no repeats!

5 Practice Tests

- ✓ 5 complete practice tests with detailed explanations
- ✓ Perfect foundation for DC CAPE test preparation
- ✓ Builds confidence and test-taking skills
- ✓ High-quality questions aligned with state standards

Start your practice journey!

6 Practice Tests

- ✓ 6 complete practice tests with detailed explanations
- ✓ **Unique tests**—different from the 5 tests book
- ✓ Perfect for more practice after mastering 5 tests
- ✓ Builds even more confidence and test-taking skills
- ✓ Same high-quality questions aligned with standards

Take your practice to the next level!

7 Practice Tests

- ✓ 7 complete practice tests for maximum preparation
- ✓ **Unique tests**—different from 5 and 6 tests books
- ✓ The most comprehensive practice for Grade 7
- ✓ Ideal for students aiming for top scores
- ✓ Extensive practice builds mastery and confidence

Go all the way with comprehensive practice!
