

# Arc Length and Area of Sectors

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Score: \_\_\_\_\_ / 24

## Q Quick Review

A **sector** is a “pizza slice” of a circle, and an **arc** is the curved edge of that slice. A sector is just a *fraction* of the whole circle, and that fraction is  $\frac{\theta}{360}$ , where  $\theta$  is the central angle. So the **arc length** is  $\frac{\theta}{360} \times 2\pi r$  (a fraction of the circumference), and the **sector area** is  $\frac{\theta}{360} \times \pi r^2$  (a fraction of the circle’s area). Find the fraction first, then multiply — it keeps things simple.

◊ **Example:** A circle has radius 6 cm. Find the area of a sector with a central angle of  $90^\circ$ . Leave your answer in terms of  $\pi$ .  
 ⇒ A  $90^\circ$  sector is a fraction of the full circle:  $\frac{90}{360} = \frac{1}{4}$  of it. The whole circle’s area is  $\pi r^2 = \pi(6^2) = 36\pi$  square cm. Now take a quarter of that:  $\frac{1}{4} \times 36\pi = 9\pi$  square cm. So the sector covers  $9\pi \text{ cm}^2$ .

**Answer:**  $A = 9\pi \text{ cm}^2$
