Q Quick Review

Function notation $f(x)$ is just a name tag for the output. When you see $f(3)$, it means “the output of the function f when the input is 3.” To find it, **substitute** the number wherever x appears, then simplify. For example, if $f(x) = 2x + 1$, then $f(3) = 2(3) + 1 = 7$. The letter doesn’t matter — $g(t)$ or $h(n)$ work the same way. Be careful with negatives: always put the input inside parentheses before you simplify, so signs don’t get lost.

◇ **Example:** If $f(x) = 3x - 4$, find $f(5)$ and $f(-2)$.

⇒ For $f(5)$, replace every x with 5: $f(5) = 3(5) - 4 = 15 - 4 = 11$. For $f(-2)$, replace x with -2 — and notice the parentheses keep the sign safe: $f(-2) = 3(-2) - 4 = -6 - 4 = -10$. Substitute first, then do the arithmetic. That’s the whole trick!

Answer: $f(5) = 11$, $f(-2) = -10$
