

Volume of Cylinders, Cones, and Spheres

Name: _____ Date: _____ Score: _____ / 24

Q Quick Review

Volume measures how much space a solid fills. For a **cylinder**, $V = \pi r^2 h$ — the circle area πr^2 times the height. A **cone** with the same base and height holds exactly *one third* as much: $V = \frac{1}{3} \pi r^2 h$. A **sphere** uses $V = \frac{4}{3} \pi r^3$. Always use the *radius* (half the diameter), and keep your answer in terms of π unless you're told to use $\pi \approx 3.14$. Volume is measured in *cubic* units.

◇ **Example:** Find the volume of a cylinder with radius 3 cm and height 10 cm. Leave your answer in terms of π .
 ⇒ The formula for a cylinder is $V = \pi r^2 h$. Plug in $r = 3$ and $h = 10$: first square the radius, $3^2 = 9$. Then multiply by the height: $9 \times 10 = 90$. So the volume is 90π cubic centimeters. Keeping the π symbol gives an exact answer.

Answer: $V = 90\pi \text{ cm}^3$
