

# Evaluating Two Variables

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Score: \_\_\_\_\_ / 18

**Quick Review and Helpful Hints**

When an expression has two variables, substitute a value for *each* one (in parentheses), then simplify using the order of operations. Be sure to replace every copy of each variable before you start computing.

▶ **Example:** Evaluate  $2x + 3y$  when  $x = 4$  and  $y = 2$ . **Work:** Substitute both values:  $2(4) + 3(2)$ . Multiply each term first:  $8 + 6$ . Then add. ★ **Answer:** 14

◆ **Practice Problems**

Evaluate each expression for the given values.

### Step-by-Step Explanations

1. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $5 + 3 = 8$ . So the final answer is 8.

2. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $6 \cdot 4 = 24$ . So the final answer is 24.

3. Step by step: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $2(3) + 7 = 6 + 7 = 13$ . So the final answer is 13.

4. Take it one move at a time: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $10 - 4 = 6$ . So the final answer is 6.

5. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $3(2) + 2(5) = 6 + 10 = 16$ . So the final answer is 16.

6. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $4 \cdot 3 + 1 = 12 + 1 = 13$ . So the final answer is 13.

7. Step by step: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $3^2 + 8 = 9 + 8 = 17$ . So the final answer is 17.

8. Take it one move at a time: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $2(5 + 1) = 2(6) = 12$ . So the final answer is 12.

9. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $5(4) - 6 = 20 - 6 = 14$ . So the final answer is 14.

10. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $\frac{12}{3} = 4$ . So the final answer is 4.

11. Step by step: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $3^2 + 4^2 = 9 + 16 = 25$ . So the final answer is 25.

12. Take it one move at a time: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $5 \cdot 2 - 5 = 10 - 5 = 5$ . So the final answer is 5.

13. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $4(-2) + 10 = -8 + 10 = 2$ . So the final answer is 2.

14. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $9 - 2(3) = 9 - 6 = 3$ . So the final answer is 3.

15. Step by step: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $A = 8 \cdot 5 = 40$  square meters. So the final answer is  $40 \text{ m}^2$ .

16. Take it one move at a time: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $2(7) + 2(3) = 14 + 6 = 20$  feet. So the final answer is 20 ft.

17. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $15(6) + 20(2) = 90 + 40 = \$130$ . So the final answer is \$130.

18. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is  $\frac{88 + 92}{2} = \frac{180}{2} = 90$ . So the final answer is 90.
