

Writing Linear Equations

Name: _____ Date: _____ Score: _____ / 18

Quick Review and Helpful Hints

To write a line as $y = mx + b$: first find the *slope* $m = \frac{y_2 - y_1}{x_2 - x_1}$ from two points (or the steady change in a table). Then find b , the y -value when $x = 0$. If you have a point and the slope, substitute them into $y = mx + b$ and solve for b .

▶ **Example:** Write the equation of the line through $(0, 3)$ and $(2, 9)$.

Work: Slope $m = \frac{9 - 3}{2 - 0} = \frac{6}{2} = 3$. The point $(0, 3)$ gives $b = 3$.

★ **Answer:** $y = 3x + 3$

slope = $\frac{\text{rise}}{\text{run}}$; b is the y -intercept.

Practice Problems

Write each line in $y = mx + b$ form.

Answer Keys

1. $y = 3x + 2$

2. $y = 2x - 1$

3. $y = -3x + 4$

4. $y = 3x$

5. $y = -x + 5$

6. $y = 2x + 1$

7. $y = 3x - 1$

8. $y = 3x - 5$

9. $y = 2x + 4$

10. $y = -x - 3$

11. $y = 4x + 2$

12. $y = -2x + 7$

13. $y = 2x + 3$

14. $y = -3x + 1$

15. $y = 40x + 50$

16. $y = -2x + 12$

17. $y = 2x - 6$

18. $y = 15x + 20$

Step-by-Step Explanations

1. Start by naming the process: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{5-2}{1-0} = 3$; the point $(0, 2)$ gives $b = 2$: $y = 3x + 2$. So the final answer is $y = 3x + 2$.

2. A good way to think about this is: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{3-(-1)}{2-0} = 2$; $b = -1$: $y = 2x - 1$. So the final answer is $y = 2x - 1$.

3. Step by step: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{1-4}{1-0} = -3$; $b = 4$: $y = -3x + 4$. So the final answer is $y = -3x + 4$.

4. Take it one move at a time: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{6-0}{2-0} = 3$; the line passes through the origin so $b = 0$: $y = 3x$. So the final answer is $y = 3x$.

5. Start by naming the process: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{0-5}{5-0} = -1$; $b = 5$: $y = -x + 5$. So the final answer is $y = -x + 5$.

6. A good way to think about this is: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{5-3}{2-1} = 2$. Use $(1, 3)$: $3 = 2(1) + b$, so $b = 1$: $y = 2x + 1$. So the final answer is $y = 2x + 1$.

7. Step by step: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{8-2}{3-1} = 3$. Use $(1, 2)$: $2 = 3 + b$, so $b = -1$: $y = 3x - 1$. So the final answer is $y = 3x - 1$.

8. Take it one move at a time: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{7-1}{4-2} = 3$. Use $(2, 1)$: $1 = 6 + b$, so $b = -5$: $y = 3x - 5$. So the final answer is $y = 3x - 5$.

9. Start by naming the process: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is The point $(0, 4)$ gives $b = 4$: $y = 2x + 4$. So the final answer is $y = 2x + 4$.

10. A good way to think about this is: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is The point $(0, -3)$ gives $b = -3$: $y = -x - 3$. So the final answer is $y = -x - 3$.

11. Step by step: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Substitute $(1, 6)$: $6 = 4(1) + b$, so $b = 2$: $y = 4x + 2$. So the final answer is $y = 4x + 2$.

12. Take it one move at a time: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Substitute $(3, 1)$: $1 = -2(3) + b$, so $b = 7$: $y = -2x + 7$. So the final answer is $y = -2x + 7$.

13. Start by naming the process: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is y goes up 2 each time x goes up 1, so $m = 2$; at $x = 0$, $y = 3$: $y = 2x + 3$. So the final answer is $y = 2x + 3$.

14. A good way to think about this is: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is y drops 3 each step, so $m = -3$; at $x = 0$, $y = 1$: $y = -3x + 1$. So the final answer is $y = -3x + 1$.

15. Step by step: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is The \$50 fee is b and \$40 per hour is the slope: $y = 40x + 50$. So the final answer is $y = 40x + 50$.

16. Take it one move at a time: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is It starts at 12 ($b = 12$) and decreases 2 per hour ($m = -2$): $y = -2x + 12$. So the final answer is $y = -2x + 12$.

17. Start by naming the process: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is Slope $= \frac{0-(-6)}{3-0} = 2$; $b = -6$: $y = 2x - 6$. So the final answer is $y = 2x - 6$.

18. A good way to think about this is: Find the slope first, then use the intercept or a point to write the equation in the requested form. The setup/work is The \$20 fee is b and \$15 per month is the slope: $y = 15x + 20$. So the final answer is $y = 15x + 20$.
