

# Factoring Trinomials

Name: \_\_\_\_\_ Date: \_\_\_\_\_ Score: \_\_\_\_\_ / 18

## Quick Review and Helpful Hints

To factor  $x^2 + bx + c$ , find two numbers that *multiply* to  $c$  and *add* to  $b$ . Then write the factors as  $(x + \square)(x + \square)$  using those numbers. Watch the signs: a positive  $c$  means the numbers share a sign; a negative  $c$  means they have opposite signs.

▶ **Example:** Factor  $x^2 + 5x + 6$ . **Work:** Find two numbers that multiply to 6 and add to 5: that's 2 and 3. Write them as factors.

★ **Answer:**  $(x + 2)(x + 3)$

	$x$	$2$
$x$	$x^2$	$2x$
$3$	$3x$	$6$

$(x + 2)(x + 3) = x^2 + 5x + 6.$

### Step-by-Step Explanations

1. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Two numbers that multiply to 6 and add to 5 are 2 and 3:  $(x + 2)(x + 3)$ . So the final answer is  $(x + 2)(x + 3)$ .

2. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to 15, add to 8: 3 and 5:  $(x + 3)(x + 5)$ . So the final answer is  $(x + 3)(x + 5)$ .

3. Step by step: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to 8, add to -6: both negative, -2 and -4:  $(x - 2)(x - 4)$ . So the final answer is  $(x - 2)(x - 4)$ .

4. Take it one move at a time: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to -10, add to -3: -5 and 2:  $(x - 5)(x + 2)$ . So the final answer is  $(x - 5)(x + 2)$ .

5. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to -24, add to 2: 6 and -4:  $(x + 6)(x - 4)$ . So the final answer is  $(x + 6)(x - 4)$ .

6. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to 21, add to -10: -3 and -7:  $(x - 3)(x - 7)$ . So the final answer is  $(x - 3)(x - 7)$ .

7. Step by step: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to -30, add to 1: 6 and -5:  $(x + 6)(x - 5)$ . So the final answer is  $(x + 6)(x - 5)$ .

8. Take it one move at a time: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to 30, add to -11: -5 and -6:  $(x - 5)(x - 6)$ . So the final answer is  $(x - 5)(x - 6)$ .

9. Start by naming the process: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to -12, add to 4: 6 and -2:  $(x + 6)(x - 2)$ . So the final answer is  $(x + 6)(x - 2)$ .

10. A good way to think about this is: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to 12, add to 7: 3 and 4:  $(x + 3)(x + 4)$ . So the final answer is  $(x + 3)(x + 4)$ .

11. Step by step: Read what the problem is asking, choose the matching rule, write the setup, and then simplify one step at a time. The setup/work is Multiply to 20, add to -9: -4 and -5:  $(x - 4)(x - 5)$ . So the final answer is  $(x - 4)(x - 5)$ .
